

The CDC has changed the definition of the word Vaccine 9.17.21

The CDC has changed the definition of the word "Vaccine". The Covid vaccines don't work as advertised so they needed to change the definition yet again.

Be sure to read the full article below.

The **bad news** is that under the new definition of "Vaccine" ("provides protection")(no mention of "immunity"), it will allow the drug companies even more leeway in getting FDA experimental authorization or even approval of more "gene therapy" shots that they can legally call vaccines. As if the FDA weren't bad enough as it is (merely a branch of the big drug companies), this development will allow them to become even more corrupt.

The **good news** is that now you can claim that you have been vaccinated without lying.

Since the new definition of a vaccine simply says "providing protection" that means that:

If you take Vitamin C, it is a proven fact that it "provides protection" against Scurvy.
If you take Vitamin D, it is a proven fact that it "provides protection" against Rickets
If you take Vitamin B1, it is a proven fact that it "provides protection" against Beriberi.

If you take Vitamin B3 (Niacin), it is a proven fact it "provides protection" against Pellagra.

There are other examples.

So if you are taking any of the above (and almost everyone should be taking the first two), then you can now legally say that you are vaccinated.

You might want to make a copy of the FDA's new definition of the word "Vaccine" -
- or copy this article and show it if you ever have to prove that you were vaccinated. And save the label off of the next bottle of Vitamin C or Vitamin D you finish as prove of your vaccine "lot number". Probably won't work --- but no harm in trying. At least now you can say honestly that you have been vaccinated.

CDC redefines 'vaccine' in wake of mRNA jab's plunging efficacy

The key word is no longer 'immunity,' but 'protection.'

Centers for Disease Control and Prevention (CDC)

Wed Sep 15, 2021 - 11:15 am EDT

WASHINGTON ([LifeSiteNews](#)) — The U.S. Centers for Disease Control and Prevention (CDC) quietly [updated its definition](#) of “vaccine” and “vaccination” on September 1 from providing “immunity” to merely providing “protection.”

Between 2015 and August 2021, the CDC [had defined](#) a vaccine as “[a] product that stimulates a person’s immune system to produce immunity to a specific disease, protecting the person from that disease.”

But following increasing [skepticism](#) over the term “vaccine” being applied to the newly developed mRNA jabs against COVID-19 from experts in medicine, the CDC adjusted the definition at the beginning of September, now describing a vaccine as “[a] preparation that is used to stimulate the body’s immune response against diseases.” Similarly, the word “vaccinating” is now, according to the CDC’s definition, less specific about the level of resistance a subject should receive from the medication.

Between 2015 and August 2021, the definition of vaccination provided by the CDC was “[t]he act of introducing a vaccine into the body to produce immunity to a specific disease.” Now, the word “immunity” has been dropped in favor of the less precise term “protection” to define vaccination as “[t]he act of introducing a vaccine into the body to produce protection from a specific disease.”

Rep. Thomas Massie (R-KY) highlighted on Twitter that the term “vaccination” had undergone a definitional overhaul already in 2015. Previously, the CDC had [described](#) vaccination more specifically as an “injection of a killed or weakened infectious organism in order to prevent the disease” the shot was designed to protect against.

Massie commented on the changing definition of “vaccination” over the years, comparing the CDC’s work with that of the ministry of truth from George Orwell’s *1984*. Investigative reporter and New York Times bestselling author Sharyl Attkisson also [commented](#) on the change. She noted that it was only after COVID-19 jabs were introduced, “and it was discovered they do not necessarily ‘prevent disease’ or ‘provide immunity,’” that “the CDC altered the definition of vaccines again to say that they merely ‘produce protection.’”

Corroborating Attkisson’s claim that the COVID shots are failing to provide the immunity originally promised by their manufacturers is renowned cardiologist and chief medical adviser to the Truth for Health Foundation Dr. Peter McCullough, M.D.

In an [interview](#) with vaccine injury lawyer Robert F. Kennedy Jr., McCullough highlighted research conducted by the Oxford University Clinical Research Group

and [published](#) August 10 in *The Lancet* which found that individuals “vaccinated” against COVID were carrying 251 times the viral load of those who had not received one of the experimental shots.

“This group had actually calculated viral load from oral and nasal secretions in the past. The viral load was 251 times that of the previous unvaccinated era where they had used the same methodology,” McCullough said. “They had previous workers and patients who had COVID-19 before any exposure to the vaccines. And now the vaccinated were carrying a massive viral load and passing it to one another.”

Accordingly, the physician noted that the “vaccinated” are more susceptible to the Delta variant of the virus and that the attending efficacy of the jabs is “far below the 50% regulatory standard to even have a vaccine on the market.”

“The vaccines are failing,” he added.

Though the CDC changed its definition of vaccination following reports of a [demonstrable downturn](#) in the effectiveness of mRNA-developed COVID shot technology, the organization has defended its decision, attempting to allay criticism that the definition is being redrawn to accommodate the failing shots.

A spokesman for the CDC [told](#) *The Epoch Times* that “[w]hile there have been slight changes in wording over time to the definition of ‘vaccine’ on CDC’s website, those haven’t impacted the overall definition.”

The spokesman said the CDC’s prior definition that vaccines provide immunity “could be interpreted to mean that vaccines are 100% effective, which has never been the case for any vaccine.” He added that “the current definition is more transparent, and also describes the ways in which vaccines can be administered.”

“It’s also important to note that the modifications to the definition of ‘vaccine’ don’t change the fact that vaccines and the act of vaccination have prevented millions of illnesses and saved countless lives,” the spokesman concluded, providing no evidence to substantiate the claim.

The CDC did not immediately respond to LifeSite’s request for additional comment.
